Mean annual cycle

• Atlantic Warm Pool

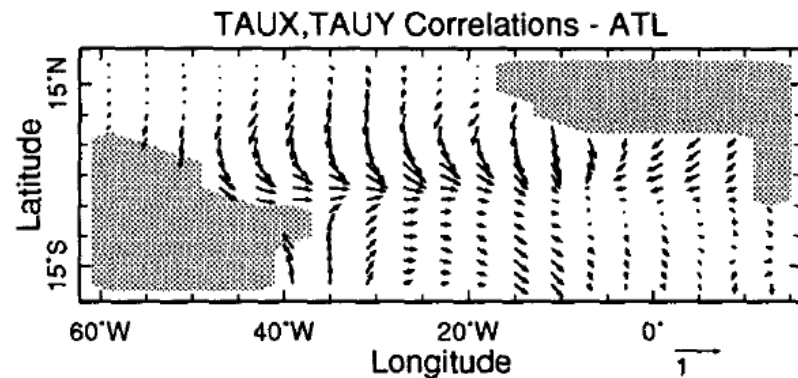

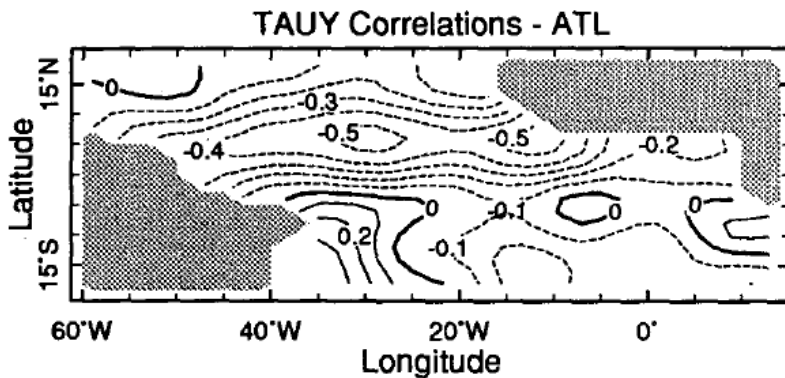

JAN
SST Climatology (°C)

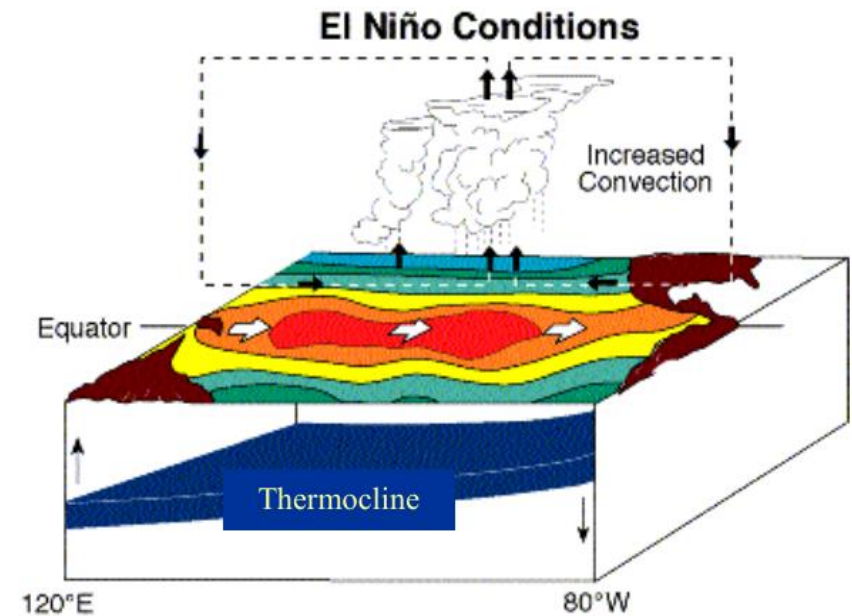

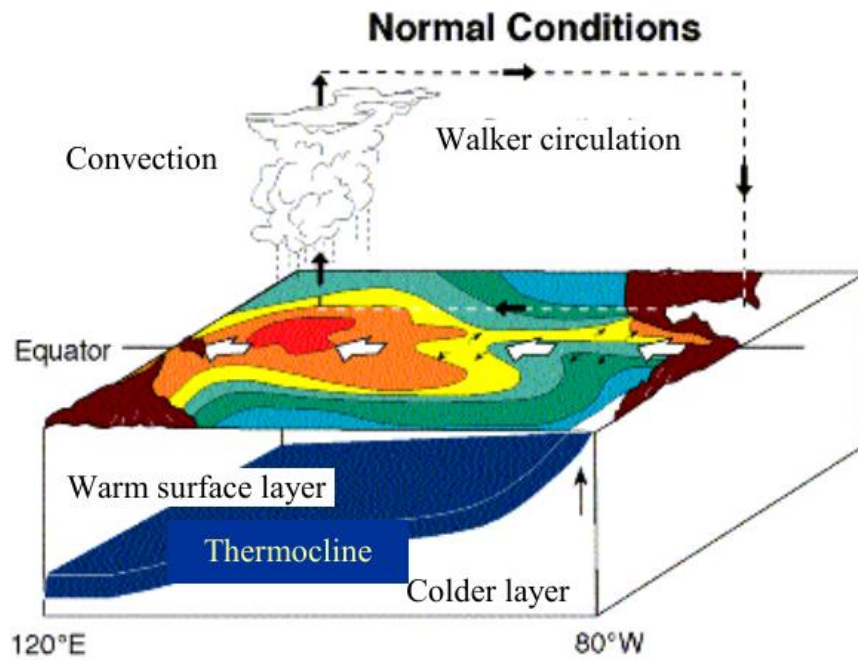

• Pacific Warm Pool

• Cold Tongues

Interannual variability

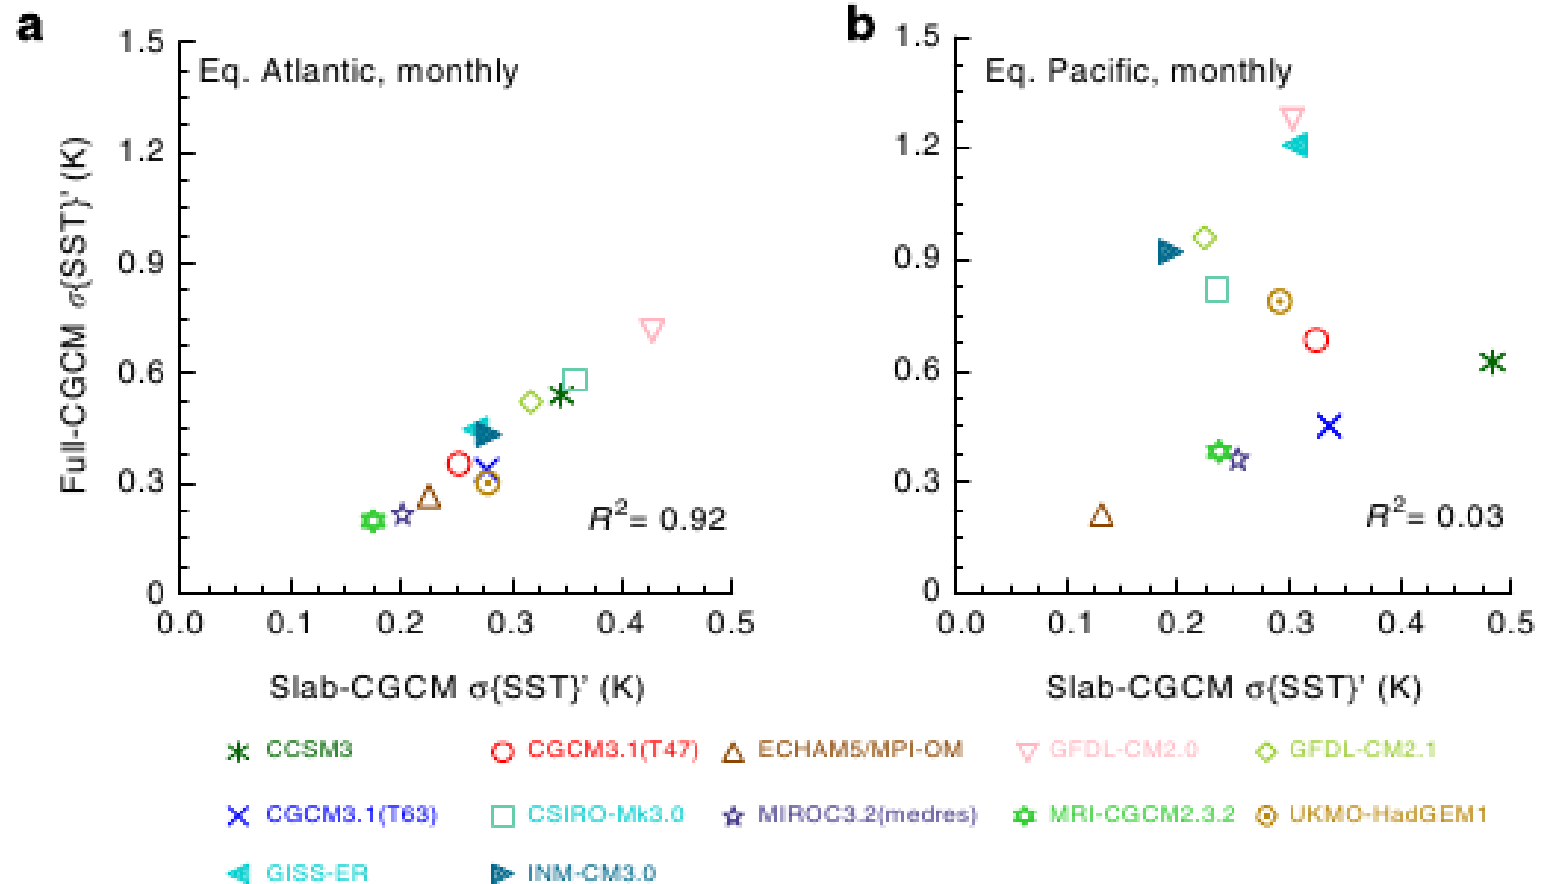

Interannual variability

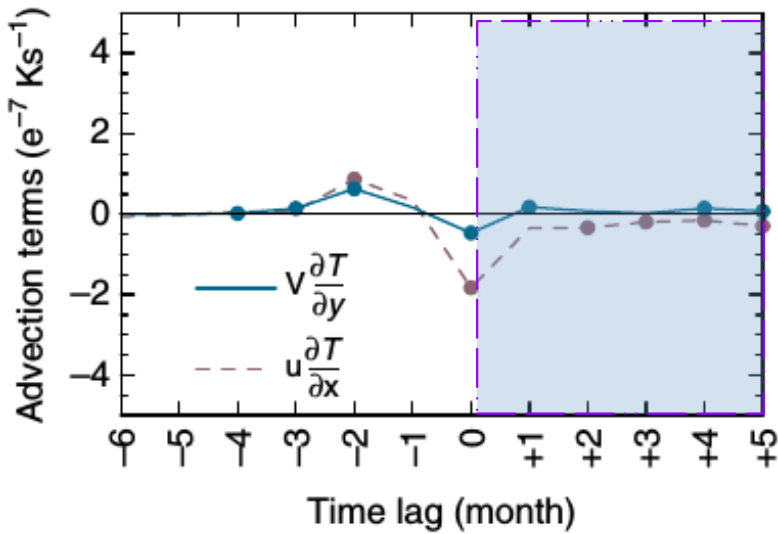

Important differences: Atlantic vs Pacific

- Seasonality
- SST amplitude and frequency
- Bjerkness feedback
- Symmetry between warm and cold events
-
-
-
-
- **Further mechanisms for the Atlantic Nino:**
- Meridional advection (Foltz and McPhaden, 2010; Richter et al., 2013)
- Deep equatorial jets (Brandt et al., 2011)

Peak lag = 0

Peak lag 2-
months earlier

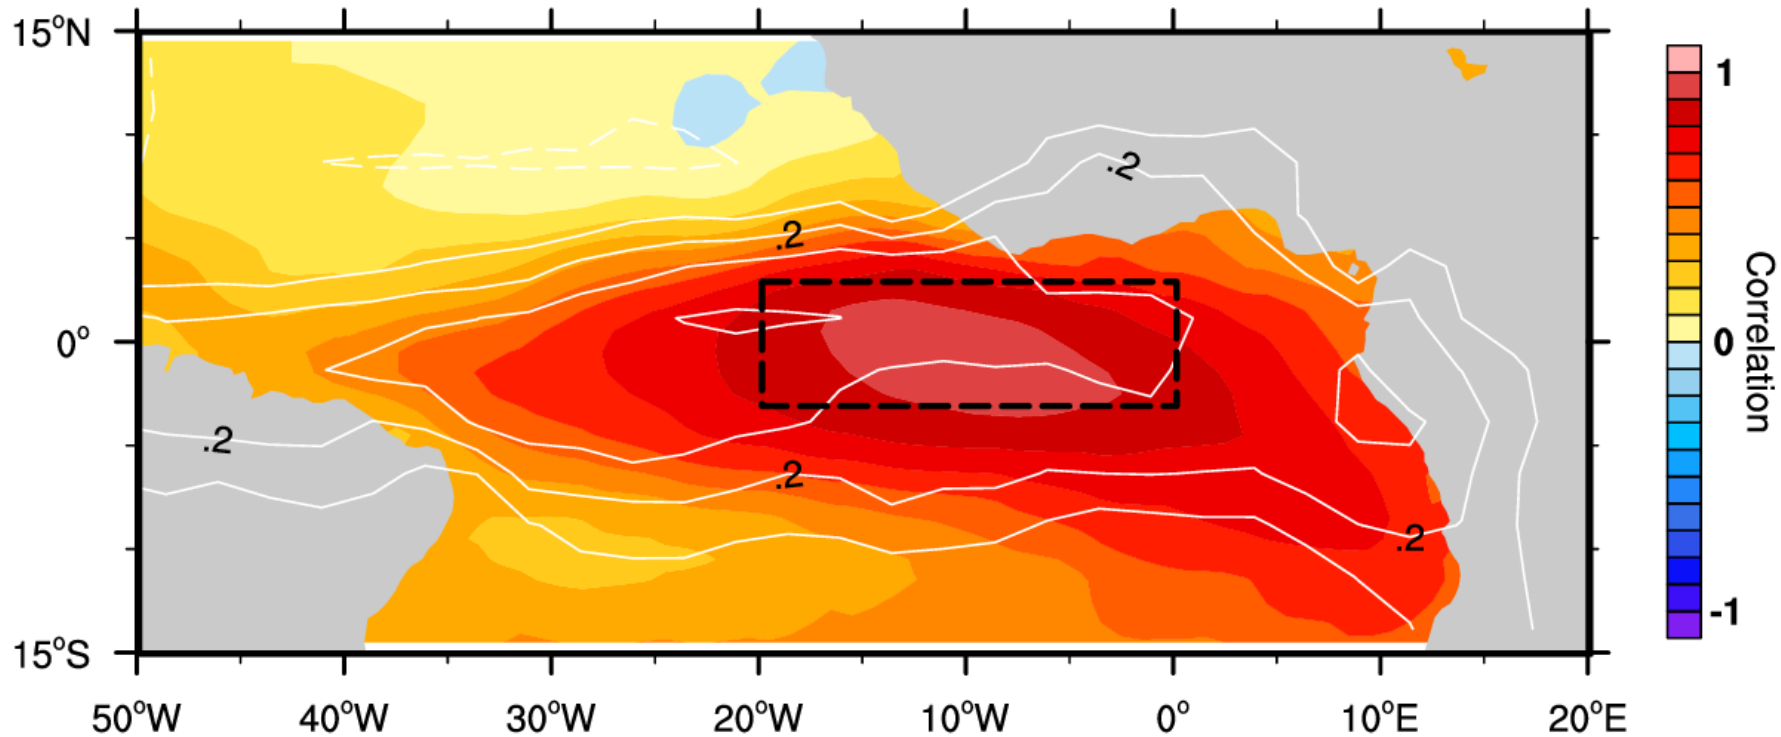

Problems with the CMIP-class models

- Mean state biases (Richter et al., 2013).
- Overestimation of Qnet contribution (Jouanno et al., 2017).

SST–rainfall correlation

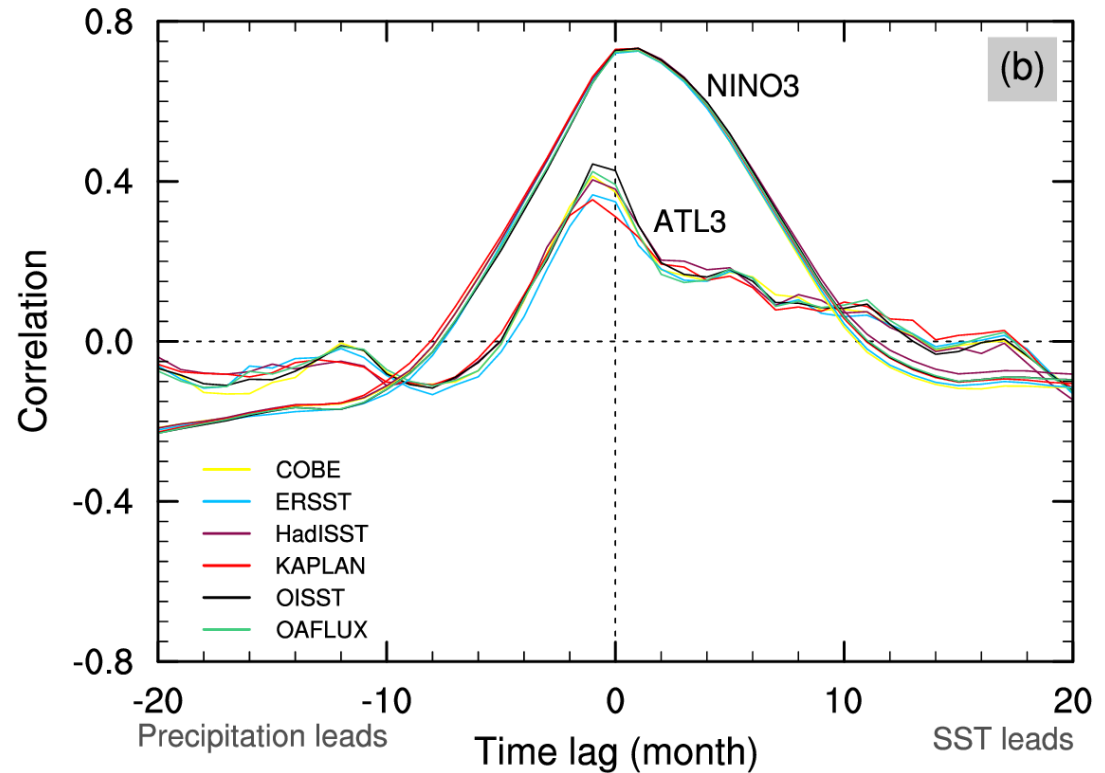

- Observations during the satellite era.
- Ensembles: reanalyses, AGCM and coupled modes

- Observations during the satellite era.

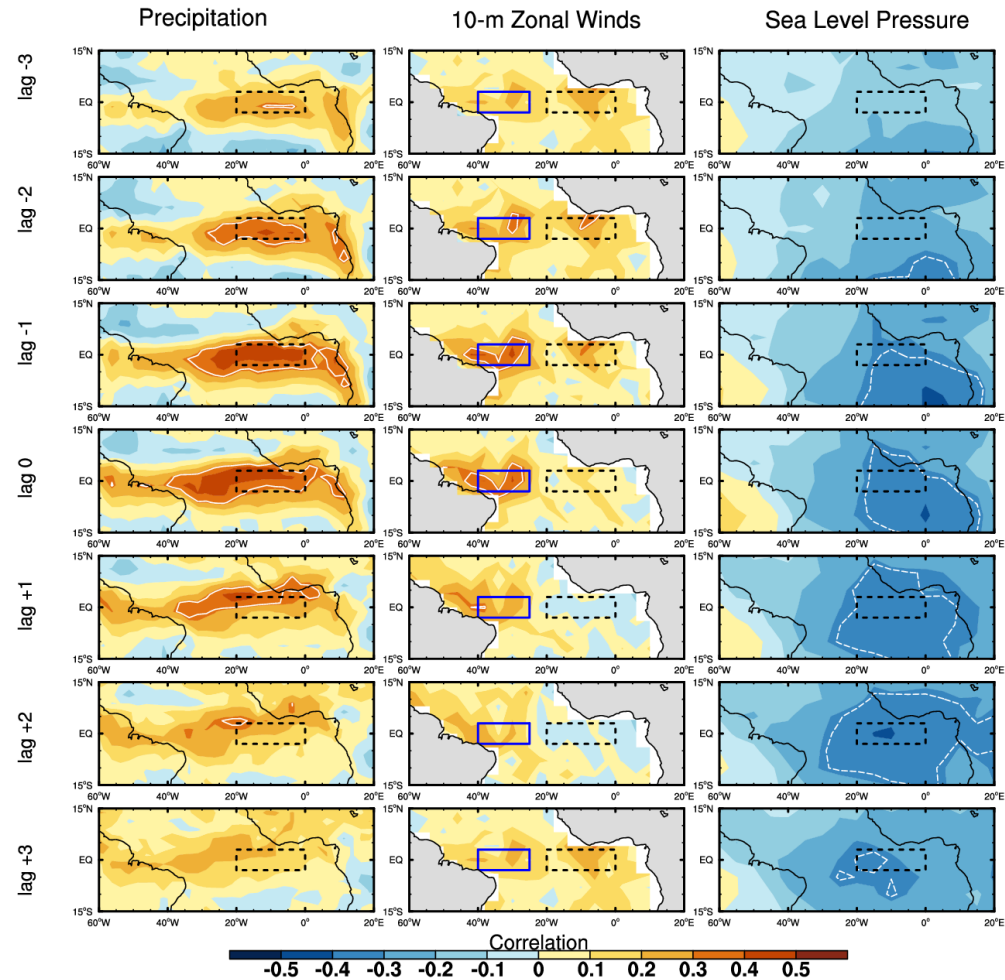

- Observations during the satellite era.

- Observations during the satellite era.

- SST leads at positive lags

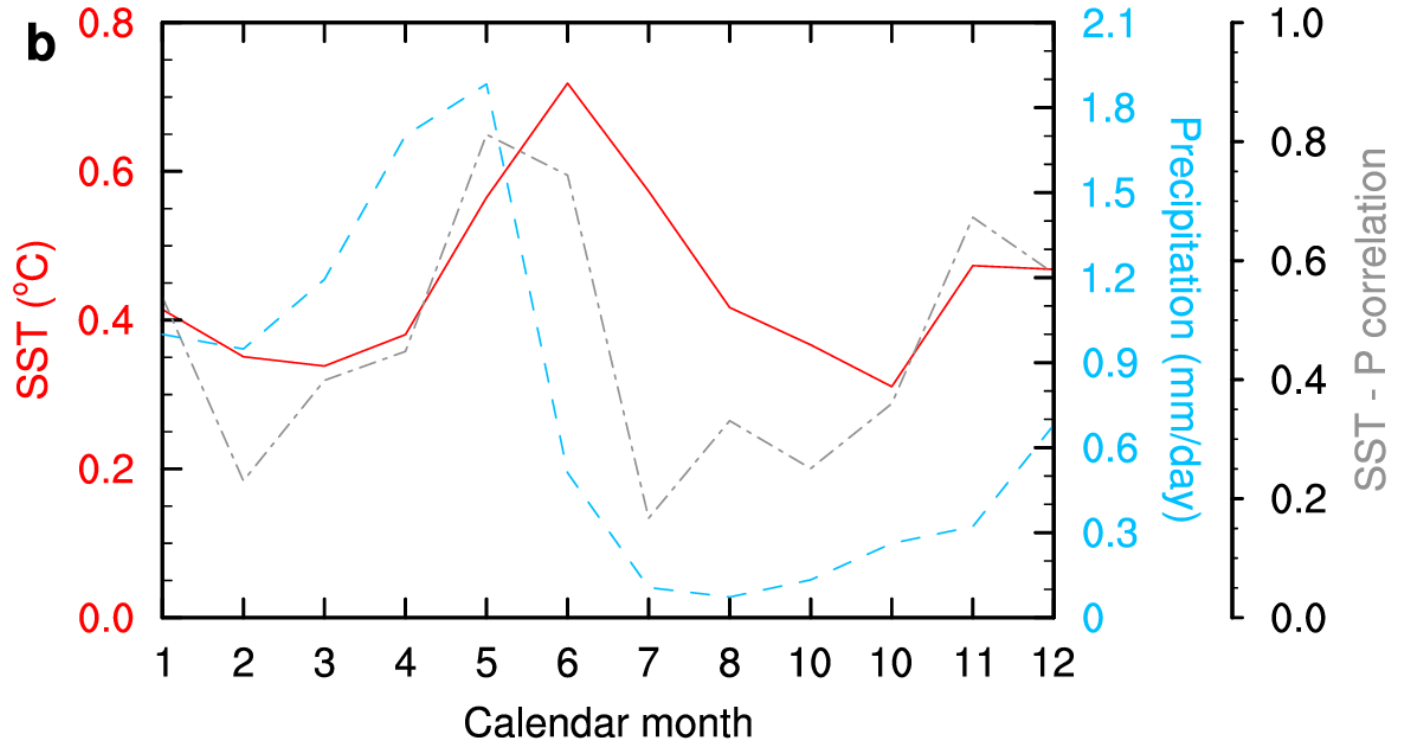

SST-rainfall correlation

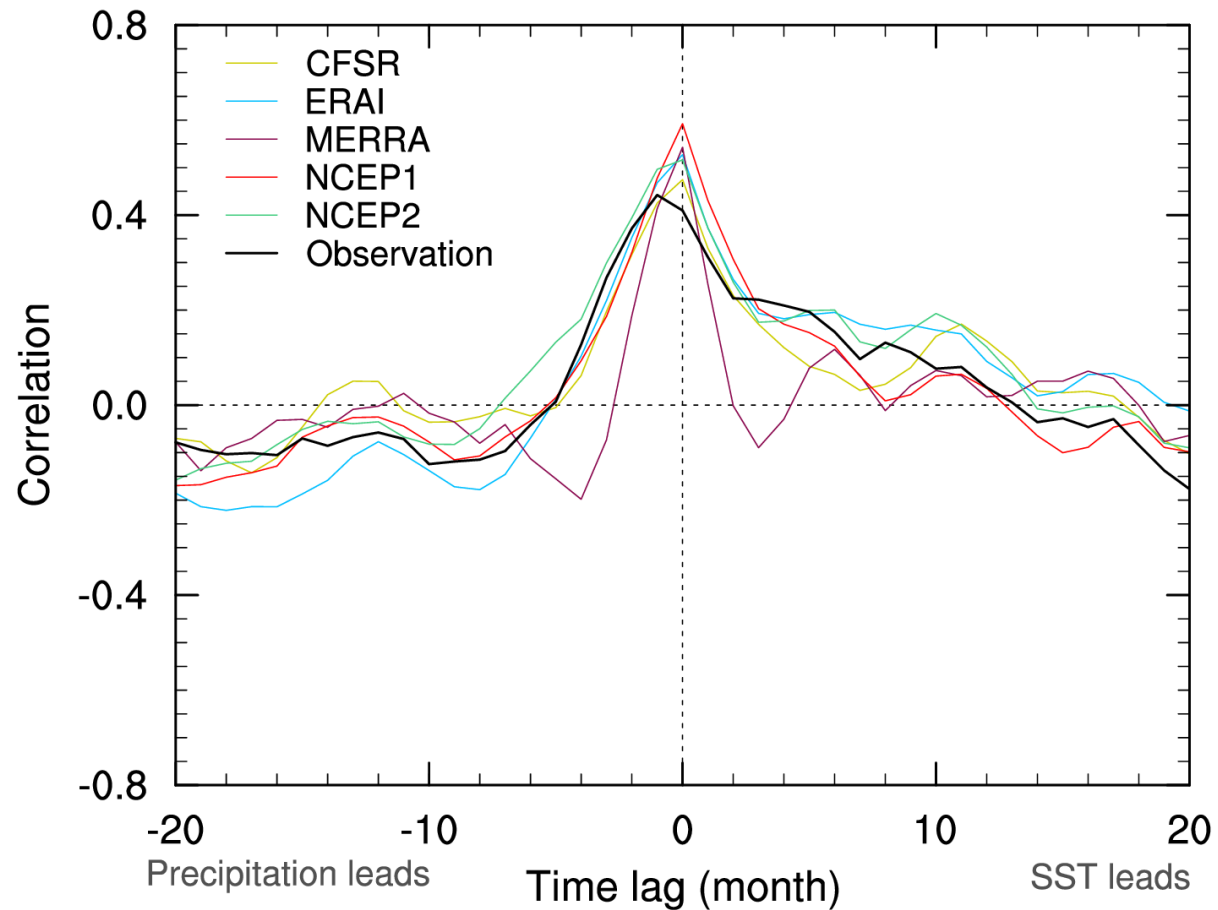

- SST leads at positive lags

- SST leads at positive lags

- No lags in reanalyses

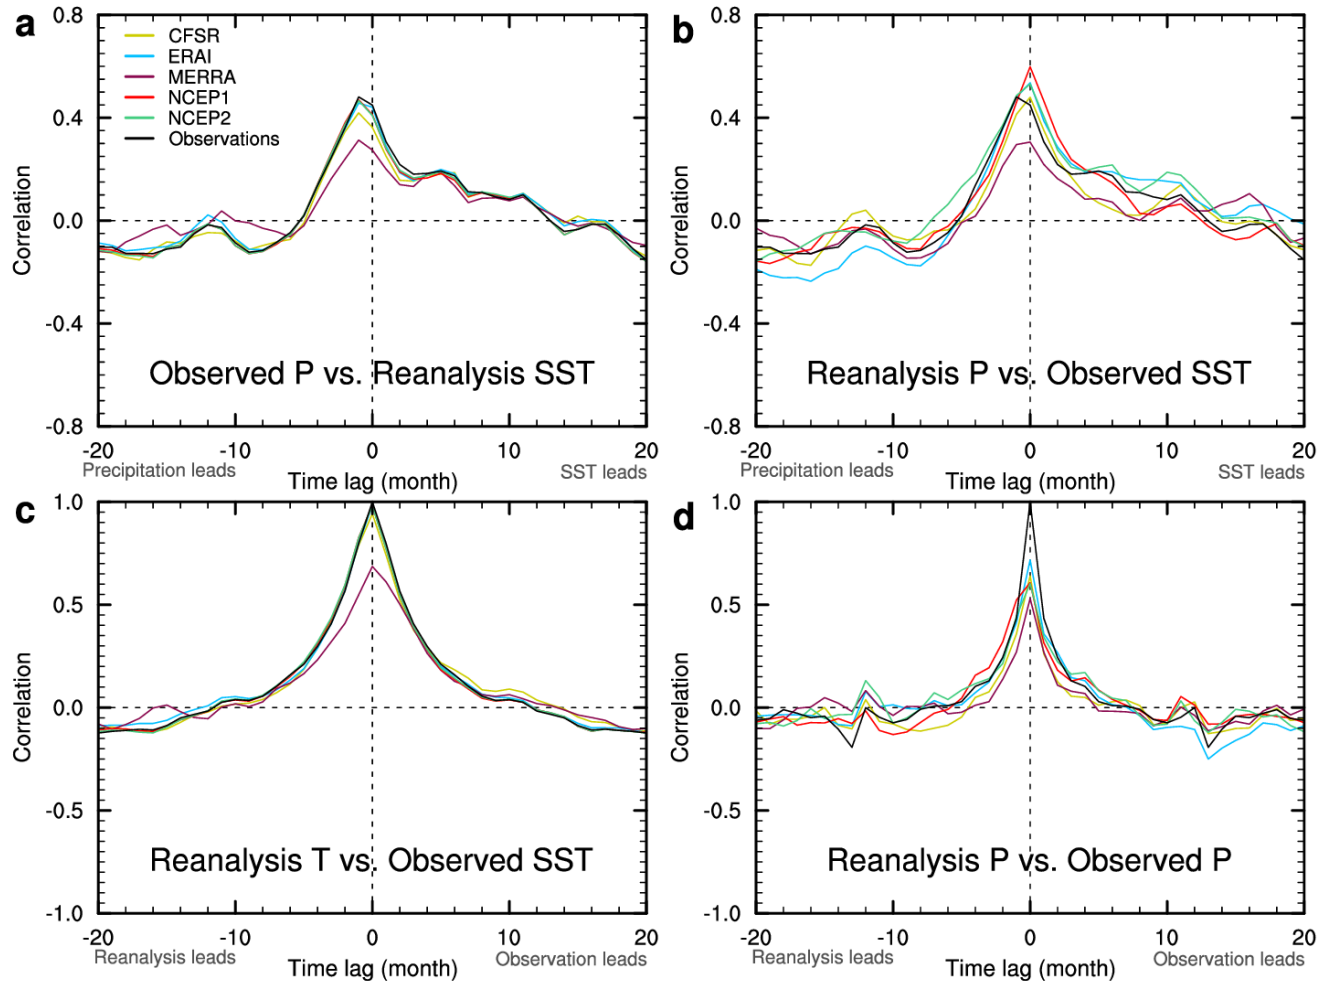

SST-rainfall correlation

- No lags in reanalyses

SST-rainfall correlation

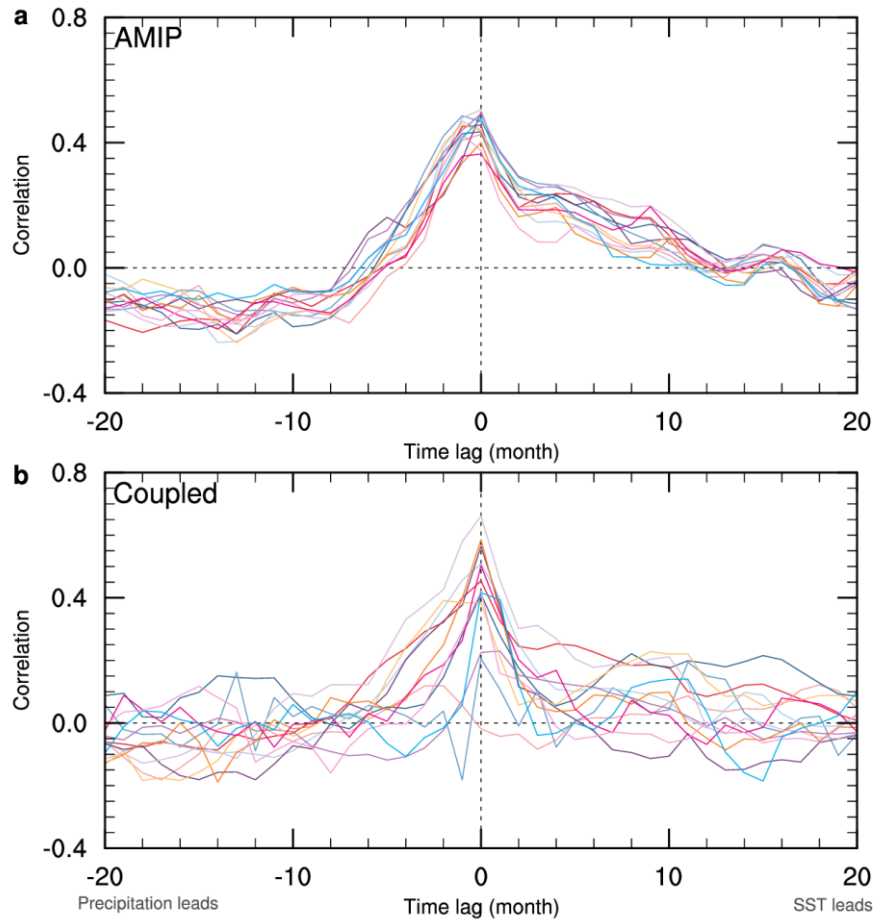

- No lags in reanalyses

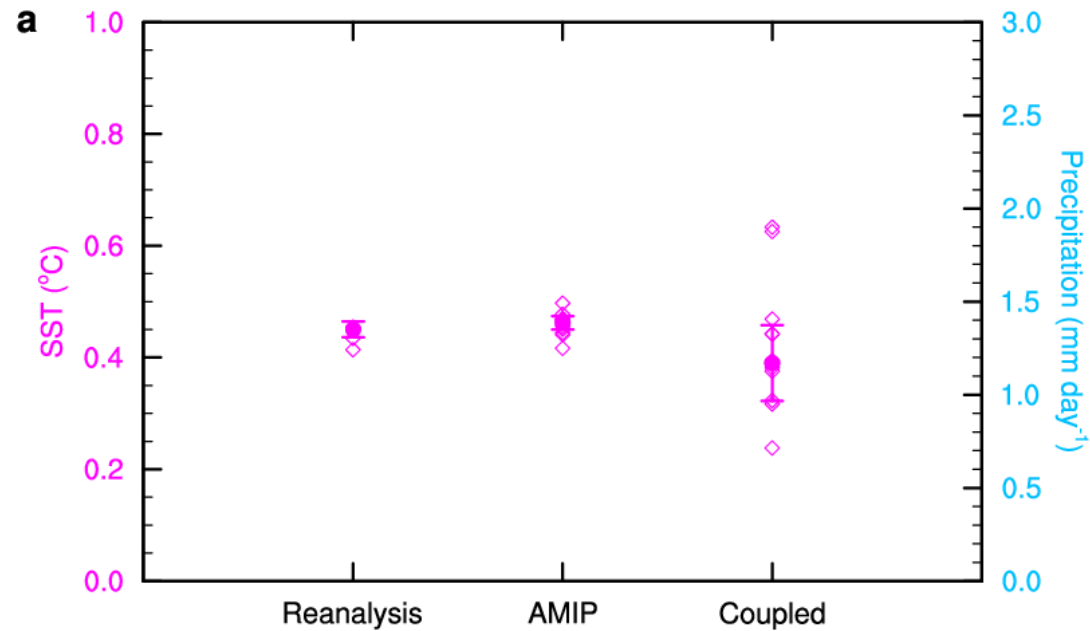

- 1- lags in AMIP experiment

- No lags in Coupled experiment

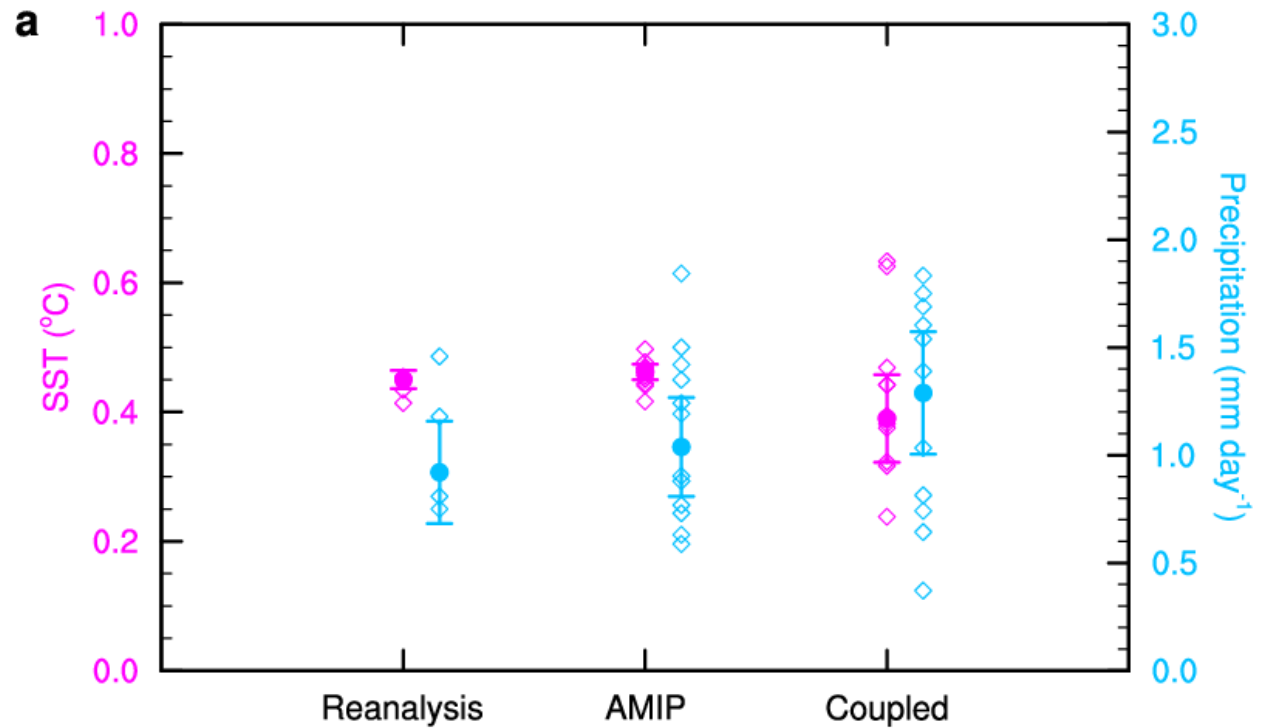

- How much of the rainfall variability is explained by the SSTs?

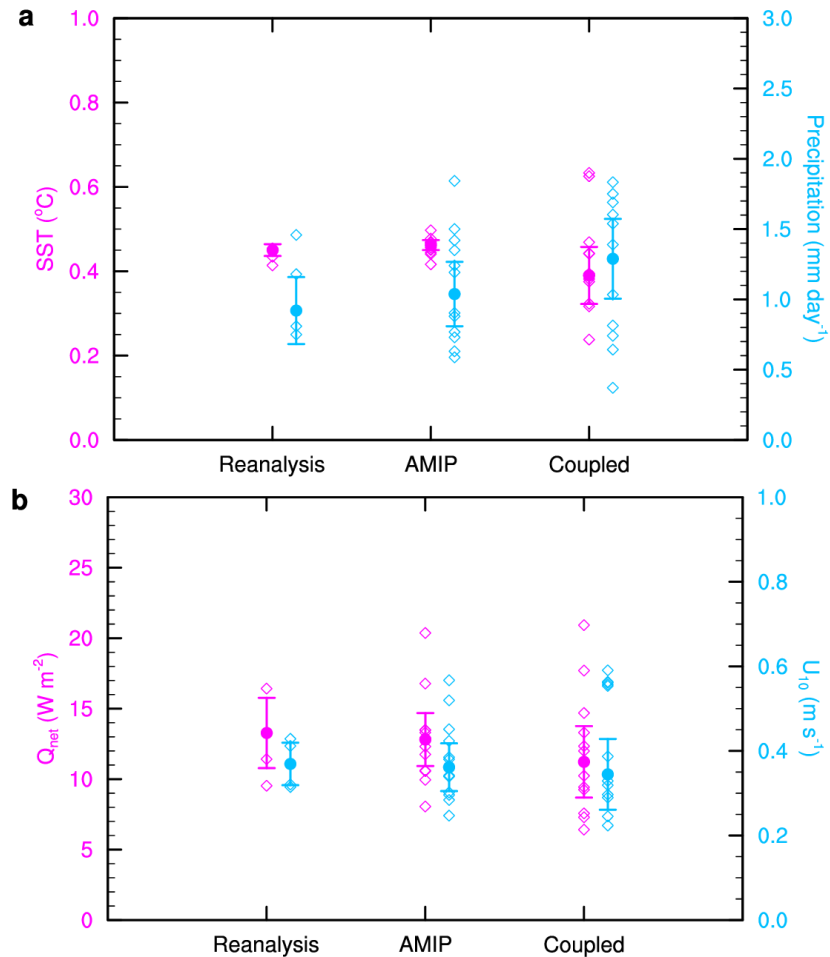

SST variability vs rainfall variability

- SST constant, **rainfall spreads**

SST variability vs rainfall variability

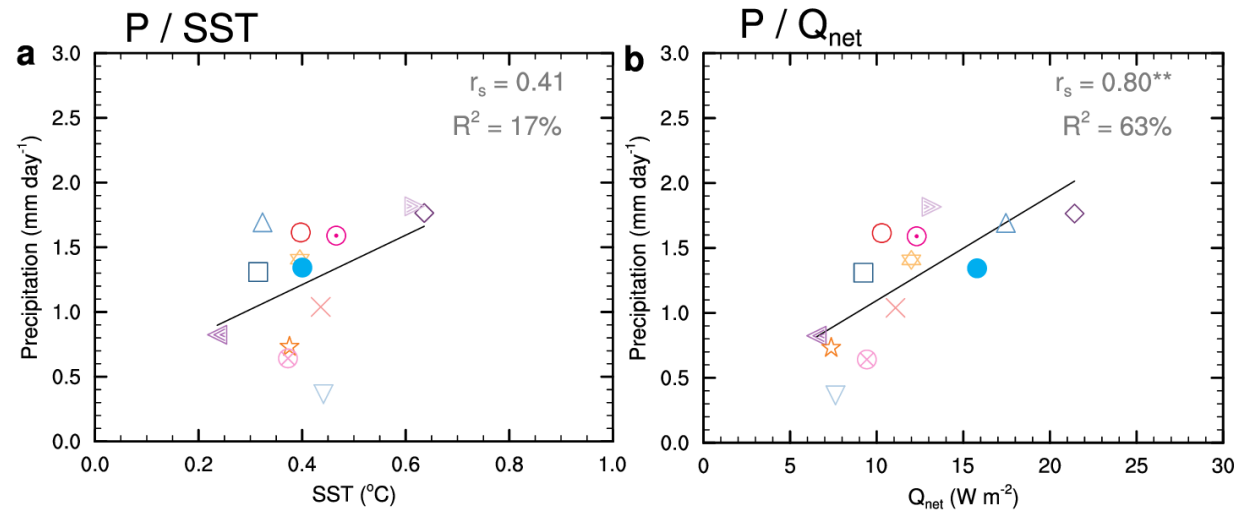

- Rainfall spread may be attributed to the atmosphere.

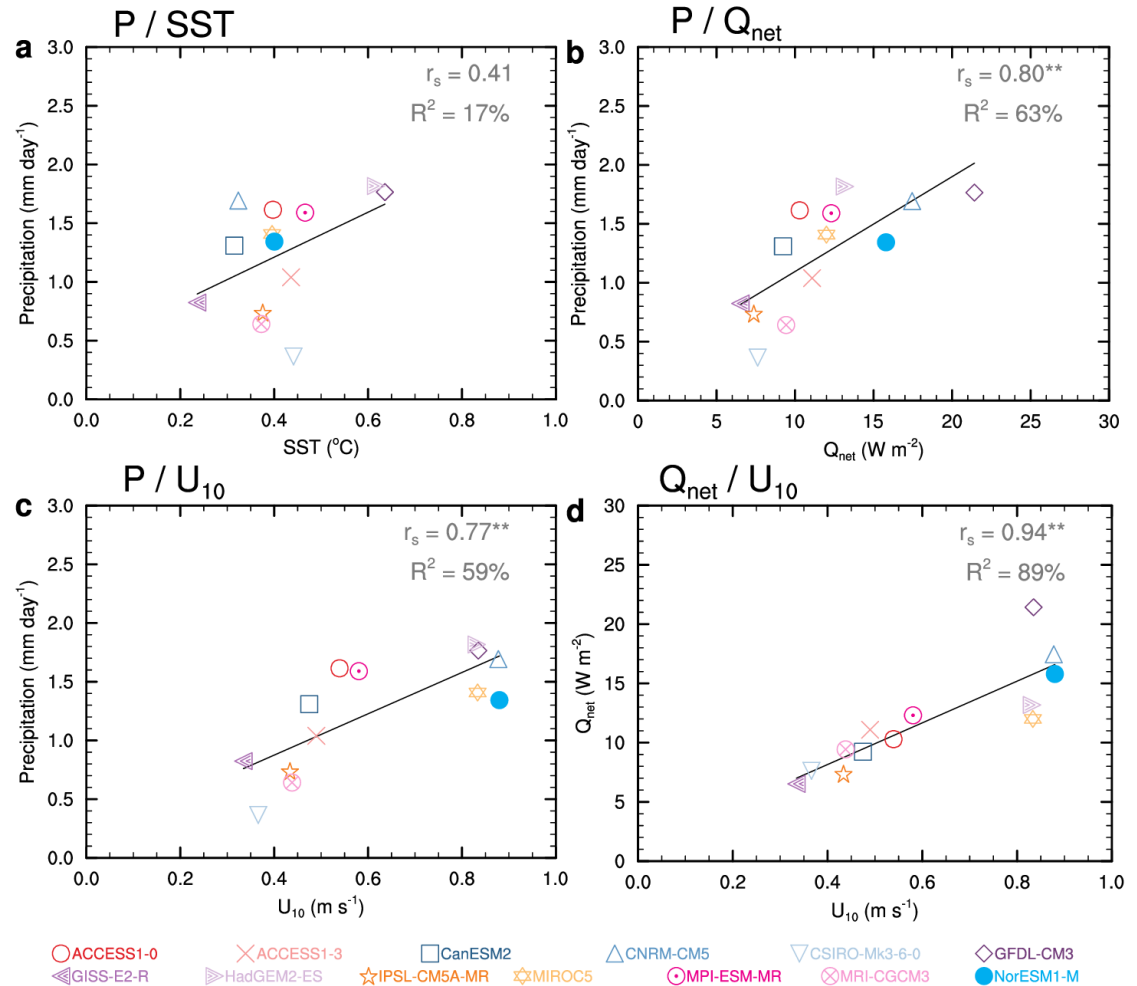

- How much of rainfall variability is explained by the SSTs?

- How much of rainfall variability is explained by the SSTs?

- How much of rainfall variability is explained by the SSTs?

- How do you warm equatorial Atlantic?
- Seasonal variability of rainfall leads that of rainfall
- Related ITCZ, diabatic heating/over land/ocean?
- Different atmospheric models respond differently to the same SST forcing
- Simulated SST does not explain the rainfall in coupled models
- **Weak Bjerkness coupling cannot be explained away by badly simulated fluxes**
- **Improving predictability requires understanding (of the atmosphere), possibly beyond simply improving biases**
